

In **[!UICONTROL Create Simulated Users]**, edit the JSON template to define users, then click **[!UICONTROL Format JSON]** and **[!UICONTROL Save]**.

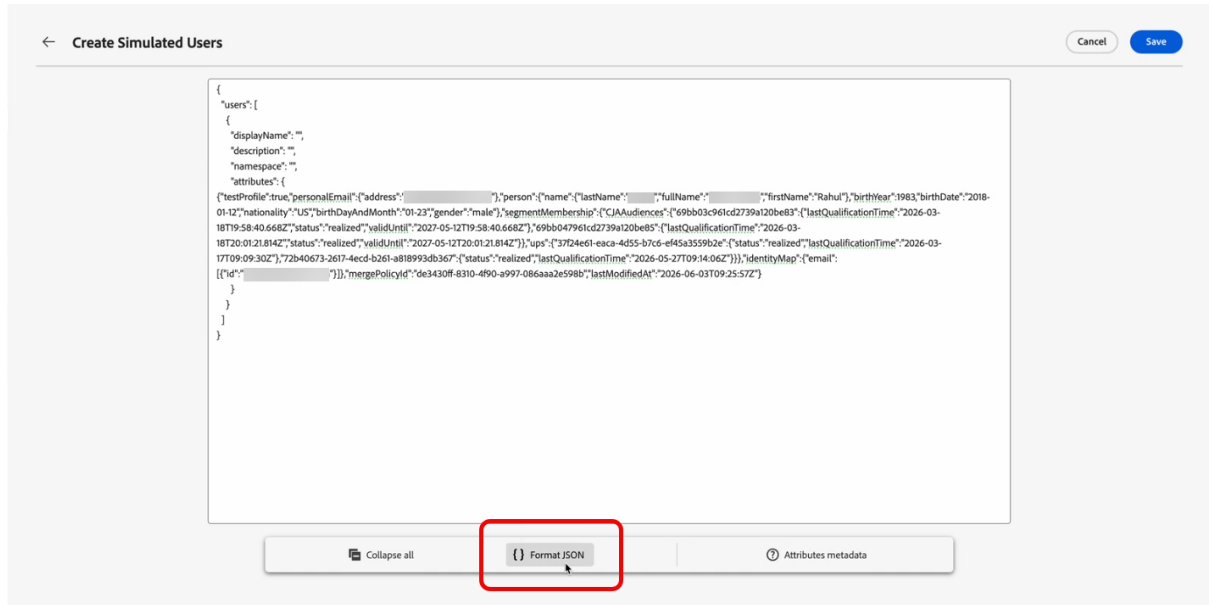

To reuse attribute values from a profile or [test profile](#) in **[!DNL Adobe Experience Platform]**:

1. Browse to the profile you want to use as a reference. On the profile detail page, click **[!UICONTROL View JSON]**. [Learn more](#)

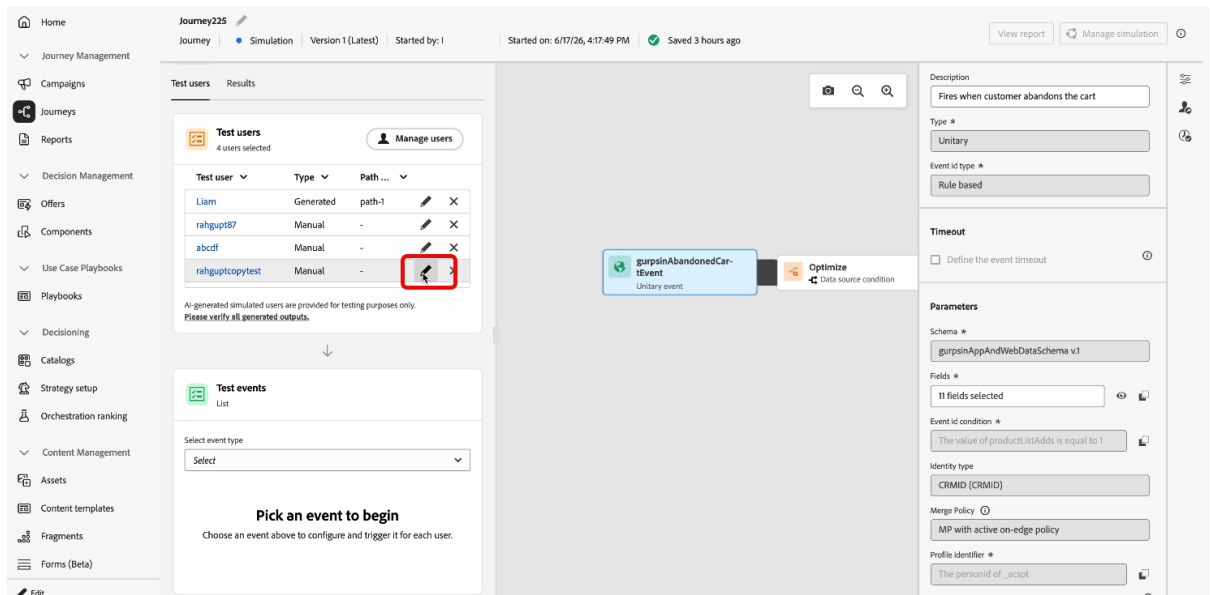

2. Copy the JSON from the viewer.
3. In the journey, open **[!UICONTROL Simulation settings]**, start **[!UICONTROL Create Simulated Users]**, and choose **Create from JSON**.

- Paste the JSON into the matching part of the simulated user template (for example, the attribute block for one user). Click **[!UICONTROL Format JSON]** to validate the structure.

- Remove properties that exist on the [!DNL Adobe Experience Platform] profile only, such as system identifiers, merge metadata, and identity collections tied to the source profile.
- Set the fields required by the simulated user template: **[!UICONTROL Display name]**, **[!UICONTROL Identity namespace]**, identity value, and channel execution addresses.
- Click **[!UICONTROL Save]**. Use  on the saved simulated user to review the data before you run **[!UICONTROL Simulation]**.

[!WARNING]

If you paste profile JSON, remove or replace all production identifiers and contact points (email, phone, ECID, push token, and similar). Simulation can send messages using the data you provide.
